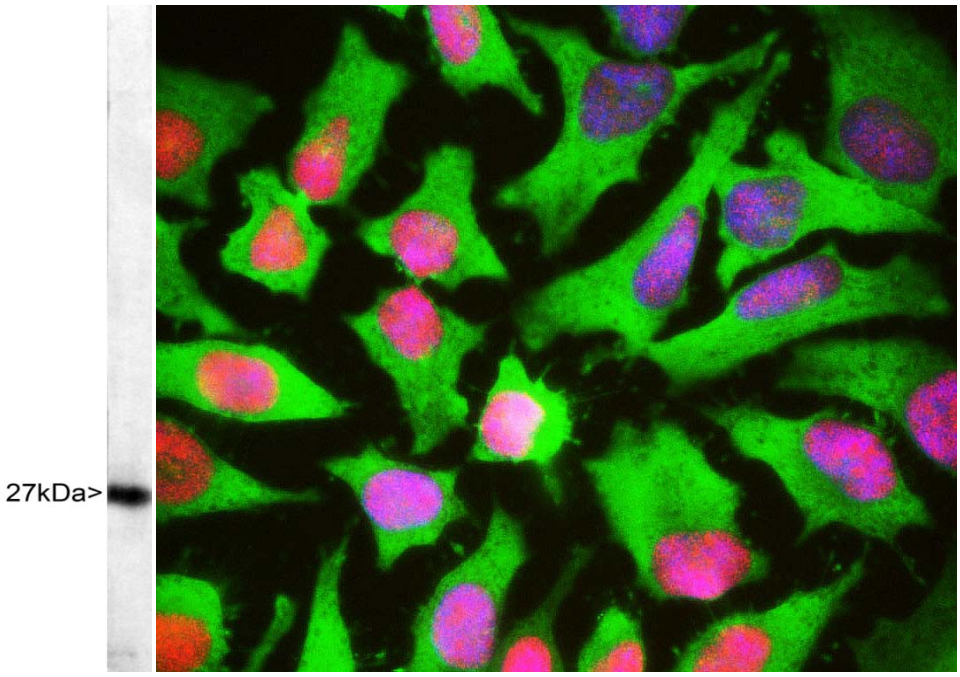
Catalogue# CPCA-HSP27: Chicken Polyclonal Antibody to HSP27: HSBP1

The Immunogen: The heat shock proteins were discovered, as the name suggests, since they are heavily upregulated when cells are stressed by temperatures above the normal physiological range. They are expressed in unstressed cells also and have a normal function as chaperones, helping other proteins to fold correctly, and are required in much greater amounts if the cell or tissue is stressed by heat. The increased levels are generated transcriptionally under the influence of a powerful transcription factor, the heat shock factor 1 (HSF1). The different heat shock proteins were originally named based on their SDS-PAGE mobility, so HSP27 has an apparent molecular weight of 27 kDa. It is an abundant protein even under non-stress conditions and frequently shows up as a major spot on 2 dimensional gels of cells or tissues. It is known to associate with a variety of other proteins such as actin, intermediate filament subunits and ubiquitin and is found both in the cytoplasm and the nucleus of cells. HSP27 can become heavily phosphorylated under the influence of multiple protein kinases particularly as a result of activation of the p38/SAPK pathway. Upregulation of this protein is protective against neurodegenerative diseases at least in certain mouse models (1). Point mutations in the HSP27 gene are associated with two neurological diseases, Charcot-Marie-Tooth disease type 2F and distal hereditary motor neuropathy IIB (2). These diseases are associated with axonal loss apparently following defects in the transport of neurofilaments. The HGNC name for this protein is HSBP1.



Left: Blot of HeLa cell crude extracts blotted with CPCA-HSP27. Note the strong clean bands at 27 kDa corresponding to HSP27. **Right:** HeLa cells stained with CPCA-HSP27 (green), and counterstained with EnCor's monoclonal antibody to High mobility Group B protein 1 (HMGB1, red) MCA-1F3 and DNA (blue). CPCA-HSP27 antibody reveals strong cytoplasmic staining and penetrates into the actin rich ruffled margins, while the HMGB1 antibody reveals strong nuclear staining which overlaps with the DNA staining.

Antibody characteristics: Antibody was raised in chicken against recombinant full length purified HSP27 from *E. coli*. This antibody is an IgY prep at a total protein concentration of 20mg/ml. The preparation contains 10mM sodium azide as a preservative. This antibody is known to react with HSP27 from human, cow, pig, mouse, rat and other mammals. Since HSP27 is highly conserved, it is likely that the antibody is effective on other species also.

Suggestions for use: The antibody solution can be used at dilutions of at least 1:2,000 in immunofluorescence experiments. In western blotting using chemiluminescence it can be used at dilutions of 1:5,000 or lower. Antibody preparation contains 10 mM sodium azide preservative (http://www.encorbio.com/MSDS/azide.htm for Material Safety Data Sheet). Avoid repeated freezing and thawing, store at 4°C or -20°C.

Limitations: This product is for research use only and is not approved for use in humans or in clinical diagnosis.
